

Module 2

WHAT ARE ORGANIZATIONS?

- They are groups of people who work independently towards some purpose.
- Organizations are not physical structures; rather, they are people who work together to achieve a set of shared goals.
- People who work in organizations have structured patterns of interactions, meaning that they expect each other to complete certain tasks in an organized way.

Who creates these organizations?

- Often an individual or a group of people, who believe that they possess the necessary skills and knowledge, form an organization to produce goods and services.

PERSONALITY

The image features a solid purple background. Overlaid on this background is a grid of small, light purple dots. A line graph, also in a light purple color, is plotted across the lower half of the image. The graph consists of approximately 25 data points connected by straight lines. The line starts at a low point on the left, rises to a peak, then fluctuates with several smaller peaks and valleys before ending at a higher point on the right. The word "PERSONALITY" is centered in the upper half of the image in a bold, white, sans-serif font.

DEFINITION OF PERSONALITY

- Personality has been defined by Salvatore Maddi as follows:

‘Personality is a stable set of characteristics and tendencies that determine those commonalties and differences in the psychological behaviour (thoughts, feeling and actions) of people that have continuity in time and that may not be easily understood as the sole result of the social and biological pressures of the moment.’

THEORIES OF PERSONALITY

1. Psychoanalytical Theory

- The Psychoanalytical theory of personality has been based primarily on the Freudian concept of unconscious nature of personality. Freud noted that his patient's behavior could not always be consciously explained and that human behavior and motivation is the outcome of such conflicting psychoanalytic concepts as the **id, the ego and the super ego**.
- **Id** is the foundation of the unconscious and is the base of libido drives. It strives for sexual pleasure and other biological pleasures and has animalistic instincts of aggression, power and domination. **Ego** is conscious in nature and is a mechanism to relate our conscious urges to the outside real world. It keeps the id in check through the realities of the external environment. While id demands immediate pleasure, whatever the cost, ego controls it so that these pleasures are granted at an appropriate time and in an acceptable manner. Because of difficulty of keeping the id under control, ego is supported by super ego. The super ego is the higher level restraining force and can be described as the conscience of the person.
- The conscience creates standards of what is wrong and what is right and is generally subconsciously developed by the absorption of cultural and ethical values of the social environment. All these three Freudian elements are inter-related and each cannot exist in isolation from others. In order to create a 'normal' personality, there must be a balance in the relationship among these three forces.

THEORIES OF PERSONALITY

2. Trait Theory

- Trait theory visualizes personality as a reflection of certain traits of the individual.
- Even though there are many traits that are common to most people, there are many other traits that are unique to a person and are not shared by other individuals.
- On the basis of the traits theory, people can be described as aggressive, loyal, pleasant, flexible, humorous, sentimental, impulsive, cool and so on.
- Traits are the basic elements of personality and can be used to summarize behaviour.
- For example, if we see people behaving in an extrovert and forceful manner in most situations, we could label their personality as aggressive.
- Similarly, if a person is observed in different situations as letting someone else take the initiative in deciding what to do, we could describe his personality as 'submissive'.

THEORIES OF PERSONALITY

3. Self-Concept Theory

- This theory is organized around the concept that personality and behaviour are largely determined by the individual himself. We tend to act in ways that are consistent with our own image of who we are. For example, a man known as a flirt would hardly stop at flirting.
- Carl Rogers is most closely associated with this theory.
- According to him, behavior can be best understood by the internal frame of reference that an individual has for his own self
- An individual himself is the centre of experience. His self-image is integral to how he views himself and his perception of how others view him.

THEORIES OF PERSONALITY

4. Social Learning Theory of Personality

- According to the learning theory, personality may be defined as the cumulative total of all the learning of a person
- The social learning theory differs from the psychoanalytical theory in two ways. Firstly, personality development has been believed to be a result of the social variables rather than of the biological drives. Secondly, motives can be traced to known and conscious needs and wants rather than unconscious and latent desires.
- ‘Reinforcement and punishment’ approach has been used to understand personality according to the social learning theory. For example, one may be frustrated because of the external environment and this can actually bring forward aggression as one of his personality traits. Similarly, an individual’s good behavior may be rewarded by the society in terms of appreciation and this further helps in reinforcement of the good behavior. Thus, it can be understood that there is a mutual interaction that exists between external environment and behavior.

The background is a solid purple rectangle. Overlaid on this is a grid of small, semi-transparent white dots. A thin, dark grey line graph is also overlaid, starting from the bottom left and trending upwards towards the top right, with several peaks and valleys. The text 'Perception, Attribution and Attitude' is centered in the middle of the image in a bold, white, sans-serif font.

Perception, Attribution and Attitude

Introduction to Perception

- The psychological processes that allow an individual to adjust his behaviour is called perception
- Perception may be defined as ‘a cognitive process by which people attend to incoming stimuli, organise and interpret such stimuli into behaviour.’
- Perception can also be defined as ‘a process by which individuals organise and interpret their sensory impressions in order to give meaning to their environment.’

COMPONENTS OF PERCEPTION

- Perception is a process of sensory organs.
- The mind gets information through the five sense organs, viz. the eyes, ears, nose, tongue and skin.
- The stimulation coming to these organs may be through action, written messages, oral communication, odour, taste, touch of the product and people.
- The perception starts with the awareness of these stimuli. Recognizing these stimuli takes place only after paying attention to them. These messages are then translated into action and behavior.
- 7 components:

Stimuli , Attention, Recognition, Translation, Behaviour, Performance, Satisfaction

COMPONENTS OF PERCEPTION

- **Stimuli:** The receipt of information is the stimulus which results in sensation. Knowledge and behavior depend on senses and their stimulation.
- **Attention:** Stimuli are selectively attended to by people. Some of the stimuli are reacted to while others are ignored without being paid any attention. The stimuli that are paid attention depend purely on the people's selection capacity and the intensity of stimuli.
- **Recognition:** After paying attention to the stimuli, the employees try to recognise whether the stimuli are worth realizing. The messages or incoming stimuli are recognised before they are transmitted into behavior.
- **Translation:** The stimuli are evaluated before being converted into action or behaviour. The evaluation process is translation. It is an overt and covert response. Perception is reflected in behaviour which is visible in different forms of employees' action and motivation.

COMPONENTS OF PERCEPTION

- **Behaviour:** Behaviour is the outcome of the cognitive process. It is a response to change in sensory inputs, i.e. stimuli. It is an overt and covert response
- **Performance:** Proper behaviour leads to higher performance. High performers become a source of stimuli and motivation to other employees. A performance–reward relationship is established to motivate people.
- **Satisfaction:** High performance gives more satisfaction. The level of satisfaction is calculated with the difference in performance and expectation. If the performance is more than the expectation, people are delighted, but when performance is equal to expectation, it results in satisfaction. On the other hand, if performance is less than the expectation, people become frustrated.

DETERMINANTS OF PERCEPTION

Perceiver's Characteristics

- Attitude: If they have positive attitudes towards the management, they directly perceive the stimuli given by management.
- Motives: The motives and desires of employees cause them to view stimuli differently as per their level and angle
- Interest: The interest of individuals draws more attention and recognition to stimuli. Less attention and recognition lowers the impact of stimuli or objects on behaviour.
- Habits: Habits die hard and therefore individuals perceive objects, situations and conditions differently according to their habits. Many employees learn quickly. Others are slow in perceiving a stimulus. Some employees are not bothered about the management.
- Experience: The experience of employees results in different levels of perception. A young employee takes time to understand the object and situation
- Expectation: Expectations distort perceptions. People see what they expect to see. If they see the object and the situation differently from their expectations, they get frustrated.
- Learning: Educated persons have higher perceptions than the less educated persons. Attitudes are developed according to the learning levels.
- Personality: The personality of a perceiving person considerably affects the stimuli transformation behavior process.

External Factors

- Size: The size of the object or stimulus has a greater impact on the perception process because the size influences attention and recognition in a more effective manner. Employees are greatly influenced by tall and well-built managers as compared to the normal-sized individuals.
- Intensity: Researchers on human behavior have revealed that the more intense the stimuli, the higher the attention and recognition in the perception process. A strong-voiced manager has more impact on supervisors and employees.
- Contrast: Contrasting objects have more impact on behavior. The purpose of contrast stimuli is to attract more attention and recognition.
- Repetition: Repeated stimuli have more impact on performances than a single statement. Repetition has the advantage of being attention-catching

Internal Factors

- Psychological setup: Factors such as attitude, interest, preferences, likings and other psychological bent of mind distort the perception process. People perceive what they like to perceive because of their attitudinal and mental approaches.
- Economic and social background: The employee's level of understanding depends upon their economic and social backgrounds.
- Learning: The state of learning influences the perception. Highly educated persons can easily and rightly perceive the management's problem. They cooperate in solution finding.
- Personality: The personality of the perceiver as well as the stimulator have an impact on the perception process. The age, sex, race, dress, facial expressions and body postures of both the persons have a direct influence on the perception process.
- Motivation: The pattern of motivation in an organization helps to develop perception building. Motivated people have the right perceptions about the stimuli, whereas the loco-profiled workers are doubtful about the message given by the management for the development.

Organizational Structure

- **Perceptual structure:** The organizational structure influences the perception of employees and other people related to the organization. The departmentalisation, decentralisation, delegation of authority and other structural frameworks have important bearings in the mind of employees. An adequate amount of decentralisation makes employees feel that the organization is welfare-oriented. Similarly, too much centralisation gives rise to the feeling of suspicion in the minds of employees.
- **Perceptual grouping:** The manager generally groups all the stimuli together to influence the employees. For example, the manager perceives that all the members cooperate with him in achieving computerisation, whereas some members really oppose mechanisation. The manager tries to close the disagreement and maintains uniformity in agreement.
- **Perceptual workplace:** The perceptual process is affected by the workplace too. The climate temperature, noise, smoke and other factors have a direct bearing on the perception and psychological traits of employees

Organizational Structure

- **Perceptual constancy:** Perceptual constancy plays an important role in the perception process. The stability and unchangeability of objects help in the constant perception process of people. The constancy of stimuli helps in easy perception because people become accustomed to the stimuli. The size, shape, place and colour of objects and situation are easily observed if they are constant.
- **Perceptual context:** The context of the stimuli with reference to objects and situations has a meaningful impact on the perceiver. If the perceiver has the confidence that the stimuli are relevant to their work and awards, they may pay more attention to the perception process, policies and objectives relevant to employees. Welfare is paid more attention.
- **Perceptual defence:** The defensive role of the management is well recognised by the employees.

Social Factors

- Social conditions have much influence on the perception process.
- The interaction between the manager and his subordinates is considered under social factors which include the stereotyping effect, the halo effect, contrast effect and projection

The background is a solid purple rectangle. Overlaid on this is a grid of small, semi-transparent white dots. A thin, dark grey line graph is also overlaid, featuring several data points connected by straight lines. The graph starts at the bottom left, moves up and down in a jagged pattern, and then trends upwards towards the top right corner.

ATTITUDE- **MEANING, NATURE &** **CHARACTERISTICS OF** **ATTITUDE**

MEANING OF ATTITUDE

- Attitude is a collection of the type of personality, feelings towards the outside world, confidence within self and more
- Attitude reflects one's feelings towards particular object, event or person.
- It shows persistent tendency of an individual to act or behave in a particular manner towards some object.
- “By attitude we mean beliefs, feelings and action tendencies of an individual or group of individuals towards objects, ideas and people. Quite often persons and objects or ideas become associated in the minds of individuals and as result attitude becomes multidimensional and complex.”

CHARACTERISTICS & COMPONENTS OF ATTITUDE

- Attitudes have **four basic characteristics- direction, intensity, salience and differentiation**.
 - The **direction** of an attitude is favorable, unfavorable or neutral. We may like, dislike or be neutral in our views about a person, a job or a situation.
 - The **intensity** of the attitude refers to the strength of the effective component. For example, we may dislike a person but the extent of our disliking would determine the intensity of our attitude towards him. Such dislike may range from weak to strong. In general, the more intense the attitude the more persistent will be such behavior.
 - **Salience** refers to the perceived importance of the attitude. Some people may not like to work with computers as they may not perceive it to be as important as a student in computer information systems for whom the knowledge of computers is mandatory for a career.
 - Finally, attitudes can be high or low in **differentiation** depending upon how strong the supporting beliefs and values of the person are.

COMPONENTS OF ATTITUDE

The attitudes, irrespective of what they are, generally consist of three major components:

1. **Evaluative Component.** The evaluative component of attitude is a function of how we feel about something. It refers to our liking or disliking for a particular person, any particular event or any particular situation. For example, you may feel positively or negatively about your boss, about your friend, about the movie you have seen or about anything you see.
2. **Cognitive Component.** Feelings, however, do not simply and automatically develop. Most often they are based on knowledge. For example, if you know that your friend is talking ill about you behind your back, such knowledge would result in negative attitude towards your friend. These beliefs comprises the cognitive component of attitude.
3. **Behavioural Component.** What you believe about something and how you feel about it would determine your behaviour regarding that particular person, event or situation. For eg, if you believe that your boss is embezzling company funds you are likely to behave with little respect for him. Such predisposition to act in a certain way contributes the behavioural component of the attitude.

ATTITUDE FORMATION

While attitudes are basically learned over the years, some inherited characteristics do affect such attitudes

EXPERIENCES

**PERCEPTUAL
BIASES**

**OBSERVATION OF
THE OTHER
PERSON**

ASSOCIATION

PERSONALITY

FUNCTIONS OF ATTITUDE

The American psychologist Daniel Katz outlined four functions of attitudes.

- **Adjustment Function:** This function helps individuals adjust to their environment.
- **Ego-Defensive Function:** The ego-defensive function refers to holding attitudes that protect our self-esteem or that justify actions that make us feel guilty.
- **Value-Expressive Function:** Value-expressive attitudes enable the expression of the person's centrally held values.
- **Knowledge Function:** The knowledge function refers to our need which is consistent and relatively stable. This allows us to predict what is likely to happen, and so gives us a sense of control.

MEASUREMENT OF ATTITUDE

- It has been discussed earlier that studying attitude of an individual is very important to predict his behavior and reasons behind the behavior. Various methods have been developed to assess attitude of employees and executives in an organization. Some important methods are explained as below:

**Thurston
Attitude
Scale**

Likert's scale

Interviews

- **Thurston Attitude Scale:** Thurston attitude scale is comprised of questionnaires which are filled up by the employees. This method of attitude scaling is widely used for measurement of attitude. The scaling procedure was developed before the wide use of computers and, therefore, relied heavily on manual procedures. However, with the rapid introduction of computers in the late 50's and early 60's, Thurston scaling procedures became less dominant.
- **Likert's scale:** In this method every statement which is included in the scale has five or seven degrees of responses viz. strongly agree, agree, undecided, disagree and strongly disagree. The individual responding to the scale is asked to state the extent to which he agrees or disagrees with the statement. Score is assigned to each response and total scores of each statement are summed up to produce overall score.
- **Interviews:** Interview is the method of obtaining information about employees' attitude towards organization, job related factors, working conditions or other parameters. The interviews of workers should be taken by the representatives from outside the organization. The information obtained from the responses given by the employees is then analyzed to make a generalization about the attitude of employees.

WORK RELATED ATTITUDES

- a) **Job satisfaction:** Job satisfaction reflects a general attitude or feeling of liking or disliking of an employee towards his job. A person who is highly satisfied from his job, will express a positive attitude towards the job and the person who is highly dissatisfied, will express negative attitude towards the job.
- b) **Job involvement:** Job involvement is the degree to which an individual identifies psychologically with his or her job and consider his or her perceived performance level important to self worth. Employees with high level of job involvement identify themselves with their jobs very strongly and are generally very particular about their performance. High level of involvement leads to less absenteeism and lower turnover rates. Another concept which is very closely related to job involvement is *psychological empowerment*. Psychological empowerment is the degree to which individuals believe that they have influence over their work environment, their capability, perceived autonomy and meaningfulness of their job.
- c) **Organisational commitment:** Organisational commitment refers to the job attitude in which an employee identifies with a particular organisation and its goals and wishes to maintain his membership in that organisation. Where job involvement refers to identification with one's job, organisational commitment refers to identification with one's organisation and its goals. There is a positive relationship between organisational commitment and productivity.

WORK RELATED ATTITUDES

- d) Perceived organizational support:** Perceived organizational support is the degree to which employees feel that their organization values their involvement in the organization and cares for their well being. Usually employees perceive their organizations as supportive when the reward system in the organization is fair, they participate in the decision making and when they find their supervisors supportive to them.
- e) Employee engagement:** Employee engagement is the term which refers to individual's level of involvement, satisfaction and interest for the job he is performing. Highly engaged employees feel a strong connection with their work and the company whereas, disengaged employees just invest their time in the organisation but not energy and attention into their work.

Learning Theories

IMPORTANCE OF LEARNING THEORIES

- 1. Informing Instruction:** By giving professionals an understanding of how different people learn, learning theories help them adapt their teaching strategies to fit the requirements of a wide range of learners.
- 2. Improving Learning Outcomes:** Instructors can improve the learning process and raise motivation among pupils, participation, and accomplishment.
- 3. Facilitating Professional Development:** Comprehending learning theories is crucial for instructors to engage in self-reflection, pinpoint opportunities for growth, and modify their teaching methods to accommodate students' changing requirements.
- 4. Guiding Research:** Theories of learning serve as a basis for studies on education by directing study topics, methodology, and assumptions.
- 5. Promoting Innovation:** Theories of learning stimulate investigation novel methods of instruction and learning, which promotes innovative thinking and experimentation.

THEORIES OF LEARNING

**1. COGNITIVE
LEARNING**

**2. SOCIAL
LEARNING
THEORY**

**3. OPERANT
CONDITIONING**

**4. CLASSICAL
CONDITIONING**

5. BEHAVIORISM

1. COGNITIVE LEARNING

- A theory of learning known as cognitive learning places special emphasis on the function of cognitive processes in knowledge understanding, retention, and application.
- It implies that people actively make sense of their experiences and direct their learning using their cognitive capacities.
- According to this theory, students need to actively engage with new material, make links with what they have previously learned, and modify their cognitive processes in order to properly absorb and remember it.
- The significance of problem-solving, active engagement, and mindful thinking is emphasized by cognitive learning. The constructivist method, methods for resolving problems, active engagement, integration of cognitive processes, and flexible learning methodologies are all important components of cognitive education.

2. SOCIAL LEARNING THEORY

- According to Albert Bandura's Social Learning Theory, people tends to learn new skills through seeing, copying, and imitating other people's conduct in social situations.
- It highlights how results from behavior, personal characteristics, and external factors interact to shape learning.
- This idea emphasizes how important it is for education and behavior modification to have conducive surroundings, opportunities for social learning, and positive role models.

3. OPERANT CONDITIONING

- The operant conditioning hypothesis developed by B.F. Skinner investigates how behavior is affected by its outcomes.
- On the basis of the results of a behavior, such as punishment or reinforcement, it is either enhanced or diminished.
- People learn to adjust their behavior by making linkages with the results. To encourage desired actions and outcomes, this idea finds applications in therapy, parenting, and education.

4. CLASSICAL CONDITIONING

- Classical conditioning describes how people might learn by associating various stimuli.
- Ivan Pavlov was the first to show it by teaching dogs to associate receiving food with the ring of a bell.
- This process, called classical conditioning, demonstrates how learning can happen unintentionally by creating associations between stimuli.
- The hypothesis has been used to explain a number of behavioral phenomena in people, such as phobias and the learning process.

CONDITIONING

Pavlov's Dog Experiment

BEFORE CONDITIONING

DURING CONDITIONING

AFTER CONDITIONING

5. BEHAVIORISM

- A significant portion of behaviorism's foundation comes from research done by B.F. Skinner and John B. Watson.
- Behaviorists focused their research on measurable, observable behaviors rather than on interior states like emotions in an attempt to establish psychology as a science.
- Behaviorists contend that an individual's ability to learn is reliant on their interactions with the outside world. Focuses on all observable behaviors and the external stimuli that influence them.
- People change their conduct in response to the consequences they encounter from their interactions with the environment.

Thank You
